Thermal Model Simulation Analysis. The effects of heat and thermal management of structures is more and more critical as performance limits are pushed further by the need to have lighter, smaller and more efficient designs. Convection, radiation and conduction loads are obvious, but the need to include the effect of power losses and thermal energy from friction and external sources such as pipe flows means that analysts need to have more tools at their disposal to simulate thermal models ...

The Thermal Model Example. A simple ANSYS thermal model is built with 8-node brick SOLID70 thermal elements. A solid bar is formed and map meshed. The only load on this model will be a time-varying convection load on one end. The following APDL commands build the model. Note required material values Density, Thermal Conductivity, and Specific Heat:
